

AMS Licenses

Flexible Options for Every Business Size

For AMS, the Order Management System, TTC Informatik GmbH offers flexible licensing models that are precisely tailored to the requirements of companies of various sizes. Whether a micro-enterprise, medium-sized company, or large organization – a suitable license variant is available for every application scenario.

Micro-enterprises benefit from an attractive starter package that provides an affordable entry into the diverse functions and possibilities of the software. This way, even companies with few employees can benefit from a professional and powerful order management solution.

For larger companies, scalable license options are available that allow access to central functions for the required number of users.

The necessary client licenses are designed as concurrent user licenses: this means only the number of users active at the same time is licensed. This allows multiple employees to use the software flexibly in shifts. This licensing model ensures particularly economical and needs-based usage.

Your Benefits

Reduction of Unnecessary License Costs

Licensing based on the number of simultaneous users with changing access possible

Scalability Permanently Ensured

Easy adjustment with changed personnel requirements

Support for Multiple Locations

Central data storage ensures location-independent access

Cost-effective Entry for Micro-Enterprises

Basic starter packages available

Overview of AMS License Types

Server Licenses

To use AMS in your company, the purchase of an AMS server license is required.

For use at multiple locations of a company, either an additional license for the *location flag* function or another server license per location is needed.

STARTER PACKAGE

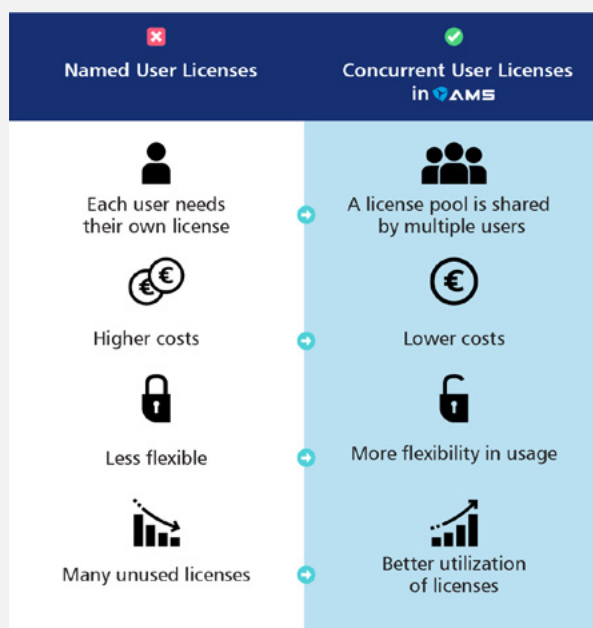

The starter package makes it easier for micro-enterprises to get started. It includes a server license and three client licenses for the AMS standard installation. An extension of the starter package with additional licenses is only possible after two years and is limited to one location.

AMS Client Licenses/Concurrent User Model

The costs for the AMS base installation as well as additional modules and functions depend on the desired number of client licenses, i.e., the users who use AMS simultaneously.

These licenses are set up according to the Concurrent User Model:

As soon as a client logs out of AMS, another client can use the license.

The model in AMS significantly reduces license costs! The licenses are not tied to specific persons like named-user licenses but can be used alternately.

Licenses for AMS Premium Features

In addition to the modules in the standard installation, numerous premium features such as the planning board or the maintenance log and other extensions are available. They can be licensed as a supplement to the standard installation.

Each premium feature or extension requires an additional license, which can then be used by all AMS clients. Concurrent use is also governed here by the concurrent user model.

An exception is the AMS^{PDC} function. Here, a separate license is required for each PDC client.

Licenses for Mobile AMS Applications

Mobile AMS applications are licensed similarly to premium features. The difference is that each mobile application requires a license for the basic service. Additionally, concurrent user licenses can then be purchased per application.
